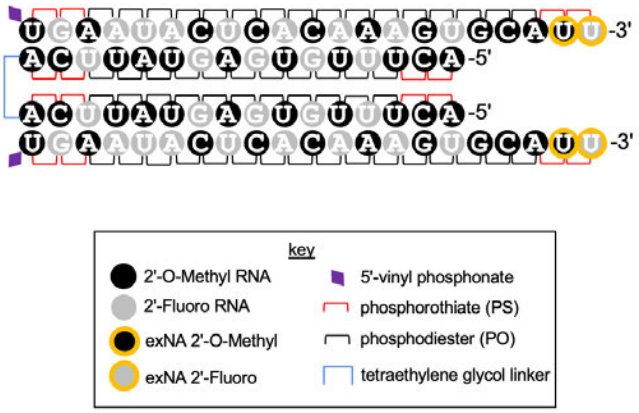
PIND 167326 | PrP-lowering divalent siRNA 2439-exNA
Type D Meeting Request

1. **Product name and application number (if applicable):**

PrP-lowering divalent siRNA 2439-exNA

2. **Chemical name and structure:**

As depicted below:



3. **Proposed indication(s):** Prion disease (symptomatic patients)

4. **The type of meeting being requested:**

Type D Meeting

5. **A brief statement of the purpose of the meeting:**

We wish to discuss the quality control testing requirements for our Drug Product.

6. **A list of the specific objectives/outcomes expected from the meeting:**

Determination of the exact tests and qualification procedures required or not required for our program and the amount of material or number of Drug Product vials required for each.

7. **A preliminary proposed agenda:**

Topic	Speaker	Time allotted
Brief introduction to this project and our patient community	Sonia Vallabh	5 minutes

Discussion of questions to the agency and any other input from agency	Sonia Vallabh and Eric Minikel	40 minutes
Summary and action items	Sonia Vallabh	10 minutes

8. A draft list of specific questions:

1. [CMC] As a class, oligonucleotides have not been known to cause growth inhibition or interfere with sterility, bioburden, or endotoxin tests. AMS uses isolator technology with vaporized hydrogen peroxide sterilization of manufacturing equipment, virtually eliminating opportunities for microbial contamination. We will fit within their established processes and media fill program. We therefore request an exemption from the qualification process for USP <71>, <61>, <85> methods for sterility, endotoxin, bioburden.

   Can we omit the qualification process for these tests?

2. [CMC] Our patient population and number of patients is consistent with an "N-of-few" risk profile while employing state-of-the-art isolator fill-and-finish that is significantly lower risk than USP <797> hospital compounding pharmacies. We therefore propose to reduce the sterility testing burden to 1 vial of DP.

   Is 1 vial sufficient for DP sterility testing?

3. [CMC] Manufacturing processes for oligonucleotide products use organic rather than aqueous chemistry and are not conducive to microbial contamination. Additionally, DS will already be tested per USP <61> for bioburden on release, minimizing the probability of bioburden sufficient to compromise the redundant sterilizing filters. We therefore propose to omit in-process bioburden testing.

   Can we omit in-process bioburden testing?

9. A list of all individuals (including titles) who will attend the proposed meeting from the sponsor's or applicant's organization and consultants:

Sponsor Company Attendees	Title
Sonia Vallabh, PhD	Senior Group Leader
Eric Minikel, PhD	Senior Group Leader
Kevin Fettes, PhD	CMC Consultant, FTS Pharma Consulting

	LLC
Steve Folio	VP Quality and Regulatory, Argonaut Manufacturing Services
Alissa Coffey, PhD	Project Manager, Broad Institute

10. A list of Agency staff requested by the sponsor:

Microbiology Reviewer(s)

Dr. Mariappan Chelliah, CMC Review Chemist

11. The approximate date on which supporting documentation will be sent to the review division:

The full meeting package is attached with this request.

12. Suggested dates and times for the meeting:

Wed Sept 6, 2023: 11:00a – 12:00p ET
Wed Sept 6, 2023: 1:00p – 2:00p ET
Fri Sept 8, 2023: 1:00p – 2:00p ET
Wed Sept 13, 2023: 2:00p – 3:00p ET
Thu Sept 14, 2023: 1:00p – 2:00p ET
Thu Sept 14, 2023: 3:00p – 4:00p ET

Thank you for considering our request.

Sincerely,

Sonia Vallabh
Group Leader
